CASE STUDY

Temporary chiller hire builds the ice for a seasonal London rink

Ahead of its recent seasonal opening, one of London's popular ice rinks needed reliable cooling to get the ice ready on time. For visitors, it's all festive lights and gliding across the ice. Behind the scenes, though, creating a smooth rink surface depends on consistent cooling from the very start of the build.

When the large-scale temporary rink needed additional cooling capacity to create and maintain its ice within a tight installation window, Andrews Chillers was brought in to make it happen in one of the capital's busiest locations.

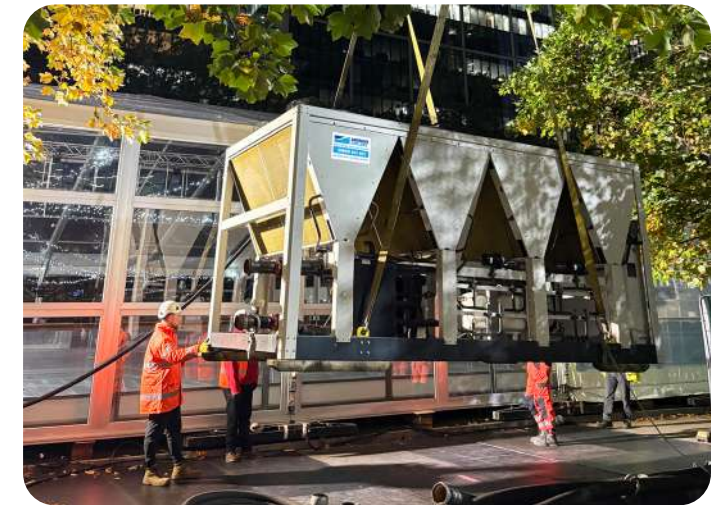

With the opening date fixed and little room for disruption, every stage of the job needed careful planning.

1 CHALLENGE

Making ice for a rink requires steady, dependable cooling from the moment the build begins.

The location added another complication. In a busy commercial district, daytime deliveries and heavy lifting would have meant working around crowds and traffic.

The chillers had to be on site and in position without disrupting the area, ready for installation straight away.

2 SOLUTION

Our expert team selected a **60kW** and a **100kW** chiller, a cooling package sized to provide the capacity needed to create and maintain the rink surface, with consistent performance and reliable temperature control.

To keep disruption to a minimum, we planned the delivery for midnight and craned both chillers into position overnight.

When the installation team arrived the next morning, the units were in place and ready, so the other contractors on site could carry on with the next stage without interruption.

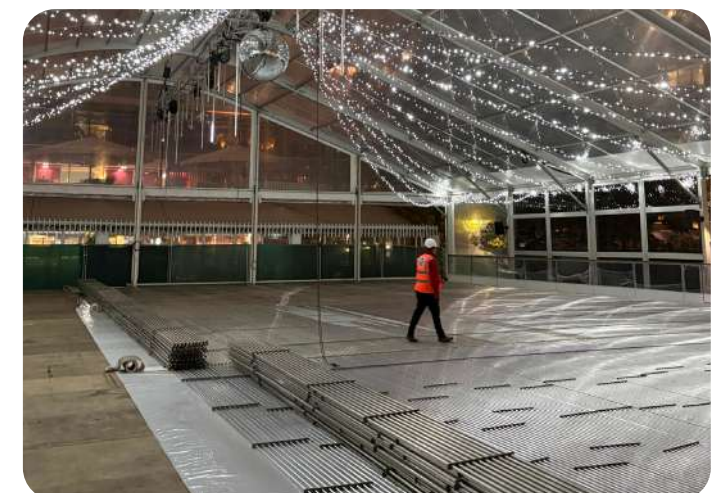

3 OUTCOME

With both chillers lifted into place overnight, commissioning was completed the next day, exactly as planned. From there, the system delivered steady, stable cooling, and the rink was able to open and run reliably right on schedule.

Pulling together the logistics, the crane lift and the installation in such a short window took careful coordination, and it paid off.

The job was delivered safely and smoothly, with minimal disruption to the site and the area around it.
